Remote Method Invocation (RMI)

1. **Remote Calculator:**
   Develop an RMI-based calculator with methods for `add()`, `subtract()`, `multiply()`, and `divide()`. The client should be able to call these methods and display results.

2. **Student Marks Management System:**
   Design an RMI system where the server maintains a list of students and their marks. The client should be able to:

   - Add a student and marks.
   - Retrieve a student's marks.
   - Calculate the average of all students' marks.

3. **Distributed Voting System:**
   Create an RMI-based distributed voting system where multiple clients can vote for candidates, and the server keeps track of the votes.
